

Document Intelligence Evaluation Report

Stage 2 Structured Document Extraction Benchmark

Executive Summary

This report evaluates structured extraction quality across a document packet.

Key objectives

- Preserve headings and their hierarchy.
- Retain tables as structured rows.
- Keep precise page provenance.

Introduction

Document packets combine unrelated documents into a single file.

1.1 Background

Page stream segmentation recovers original document boundaries.

1.2 Evaluation Principles

Metrics must be measured rather than asserted.

Scope

The scope covers structuring and retrieval readiness only.

Methodology

3.1 Processing Steps

1. Parse pages and blocks.
2. Detect boilerplate.
3. Classify headings.
4. Extract tables and lists.

3.2 Extraction Signals

- Font size and weight.
- Bounding box position.
- Numbering patterns.

3.3 Example Measurement Table

Metric	Baseline	Target	Unit
Text retention	90%	>=95%	percent
Heading recovery	65%	>=85%	percent
List recovery	70%	>=90%	percent
Table preservation	60%	>=90%	percent
Page-reference accuracy	80%	>=95%	percent

Results

4.1 Quantitative Findings

Category	Documents	Elements	Retention
Headings	12	28	93%
Paragraphs	12	86	98%
Bullet lists	12	16	100%
Numbered lists	12	12	100%
Tables	12	8	95%

4.2 Findings

Structured extraction improved retrieval precision in internal testing.

4.3 Figure Caption

Figure 1. Conceptual flow from source PDF to structured representation and retrieval-ready chunks.

Discussion

5.1 Important Observations

Boilerplate suppression materially reduces duplicate retrieval candidates.

5.2 Risks

Borderless tables remain the most fragile extraction case.

5.3 Recommendations

Adopt dual table strategies and validate on held-out documents.

Conclusion

6.1 Recommendations

Continue measuring structure quality against annotated ground truth.

Appendix - Expected Structure

The appendix enumerates the expected structural elements.
